Redes de Computadores

The Network Layer

Manuel P. Ricardo

Faculdade de Engenharia da Universidade do Porto

- » What are the main functions of the network layer?
- » What are the differences between virtual circuit and datagram networks?
- » How is forwarding handled in both type of networks?
- » What are the main functions of a router?
- » What are the formats of IP addresses?
- » How to form subnets?
- » What services are provided by ARP, ICMP, DHCP and NAT? How do these protocols work?
- » What are differences the between IPv4 and IPv6?

Network Layer Overview

Network layer

- » transports packets (datagrams)
- » from sending host to receiving host
- » functions located in every host and router

Sender

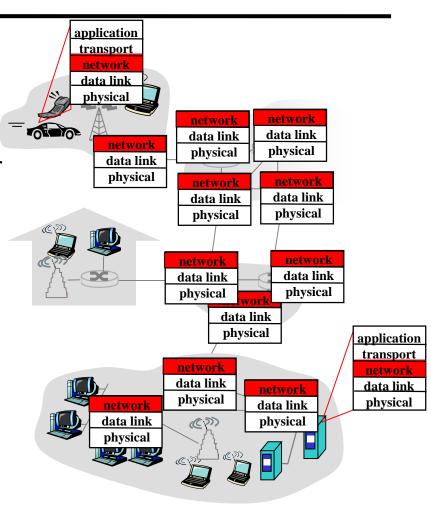

- » encapsulates transport data into packets
- » generates packets

Receiver

- » receives packets
- » delivers data to transport layer

Router

- » Receives packets from input line
- » examines network layer header
- » forwards packets through adequate output line(s)

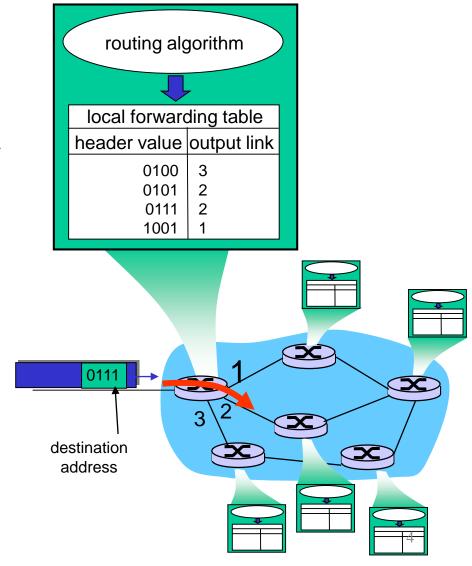

Network Layer – Main Functions

Forwarding

» router forwards packet from input port to output port

Routing

- determine routetaken by packets,from source to destination
- » algorithms, shortest path

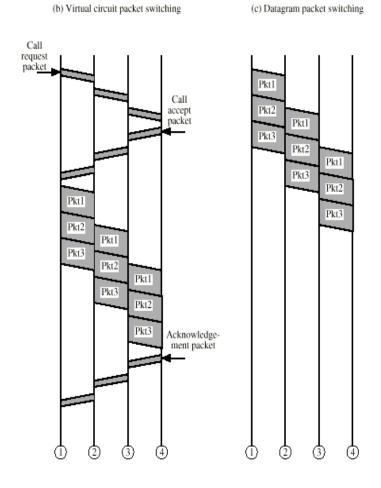

Virtual Circuits and Datagram Networks

Network Layer –

Connection and Connectionless Service

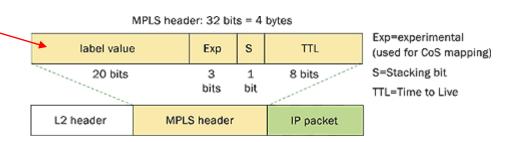

Services provided by network layer

- » Datagram network
 - → connectionless service
- » Virtual Circuit network
 - → connection oriented service

Virtual Circuit (VC)

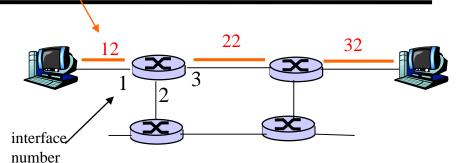

- ◆ Phases
 circuit establishment → data transference → circuit termination
- Packet carries identifier of Virtual Circuit

- ◆ Path defined from source to destination sequence of VC identifiers, one for each link along path
- Router
 - » maintains "state" for every supported circuit
 - » may allocate resources (bandwidth, buffers) per Virtual Circuit

VC - Forwarding Table

VC number

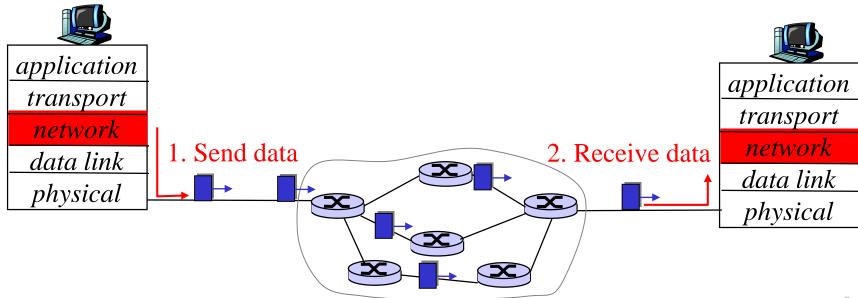

Forwarding table in northwest router:

Incoming interface	Incoming VC #	Outgoing interface	Outgoing VC #
1	12	3	22
2	63	1	18
3	7	2	17
1	97	3	87
	•••		•••

Routers maintain connection state information!

Datagram Networks

- No circuit establishment; no circuit concept
- Packets
 - » forwarded using destination host address
 - » packets between same source-destination pair may follow different paths

Forwarding Table

Destination Address Range	Output Link Interface
11001000 00010111 00010000 00000000 through 11001000 00010111 00010111 11111111	0
11001000 00010111 00011000 00000000 through	1
11001000 00010111 00011000 11111111	
11001000 00010111 00011001 00000000 through	2
11001000 00010111 00011111 11111111	
otherwise	3

• How to reduce the number of entries in the forwarding table?

Longest Prefix Matching

Prefix Match			Link	Interface
11001000	00010111	00010		0
	00010111			1
11001000	00010111	00011		2
otherwise				3

Examples. Which Interface?

```
DA: 11001000 00010111 00010110 10100001 → 0

DA: 11001000 00010111 00011000 10101010 → 1,2 → 1

longest prefix
```

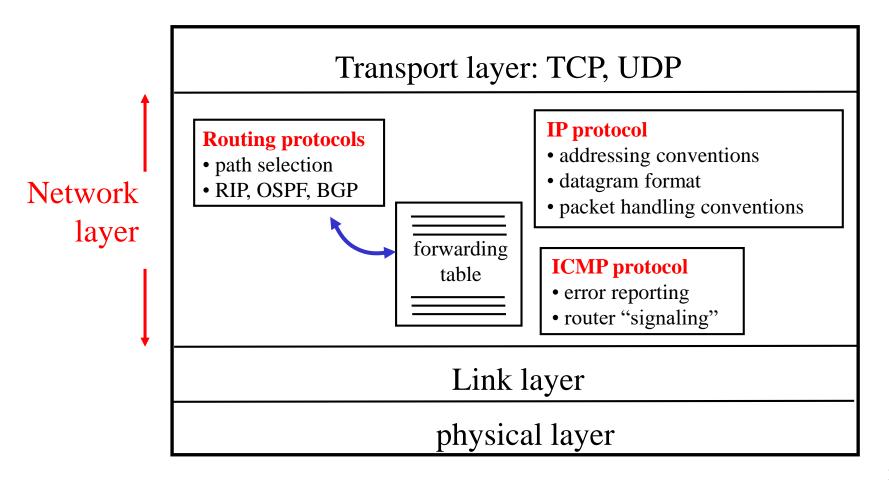

Virtual-Circuit versus Datagram Networks

Issue	Datagram subnet	Virtual-circuit subnet
Circuit setup	Not needed	Required
Addressing	Each packet contains the full source and destination address	Each packet contains a short VC number
State information	Routers do not hold state information about connections	Each VC requires router table space per connection
Routing	Each packet is routed independently	Route chosen when VC is set up; all packets follow it
Effect of router failures	None, except for packets lost during the crash	All VCs that passed through the failed router are terminated
Quality of service	Difficult	Easy if enough resources can be allocated in advance for each VC
Congestion control	Difficult	Easy if enough resources can be allocated in advance for each VC

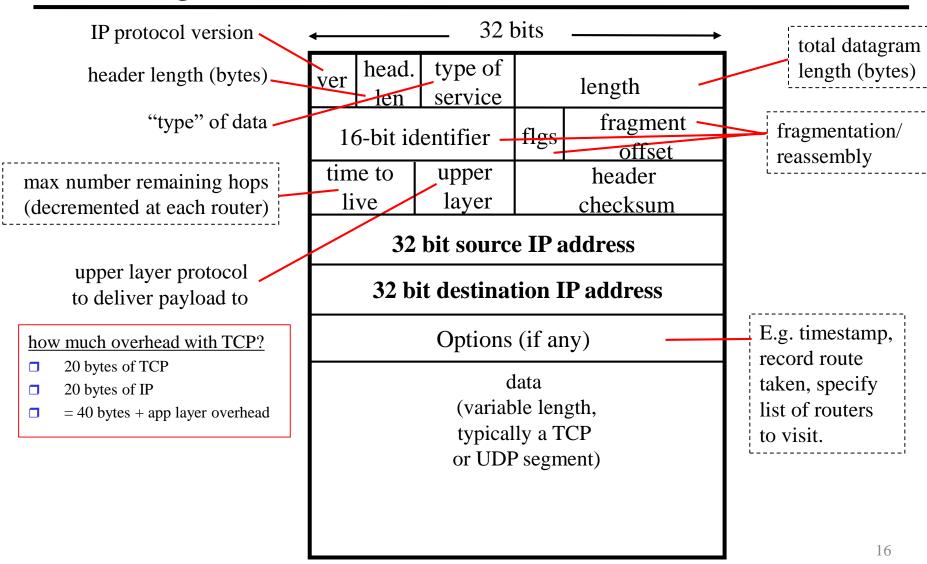

Internet Protocol

The Internet Network layer

Host, router network layer functions

IP Datagram Format

Internet Checksum

- ◆ The Internet (not layer 2) uses a checksum
 - » easily implementable in software
 - » 1's complement sum of 16 bit words
 - » Performance: d=2

- One's complement sum
 - » Mod-2 addition with carry-out
 - » Carry-out in the most-significant-bit is added to the least-significant bit
 - » Get one's complement of "one's complement sum"

```
1010011

0110110

carry-out ① 0001001

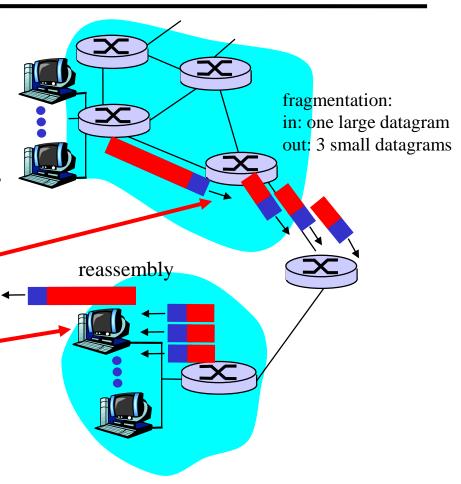

Carry wrap-around 0000001

0001010

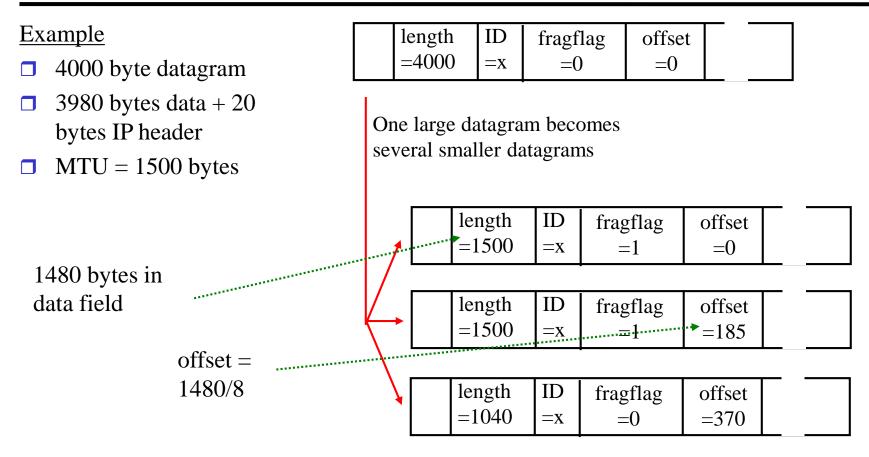

One's complement = 1110101
```

IP Fragmentation and Reassembly

- Network links have MTU
 - » MTU max. transfer size
 - » largest possible link-level frame
 - » different link types, different MTUs
- Large IP datagram is fragmented
 - » one datagram → n datagrams
 - » "reassembled" at final destination
 - » IP header bits used to identify, order related fragments

IP Fragmentation and Reassembly

IP Addressing - Introduction

IP address

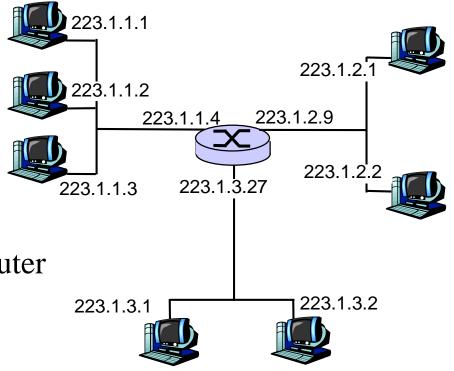

» 32-bit identifier for host/router interface

Interface

» connection between host/router and physical link

» Routers have multiple interfaces

» IP addressesassociated with interface

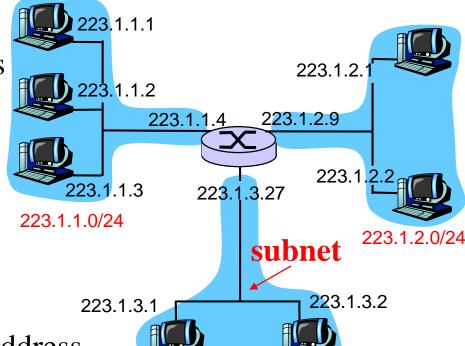

223.1.1.1 = 11011111 00000001 00000001 00000001

223 1 1 1

Subnets

Network consisting of 3 subnets

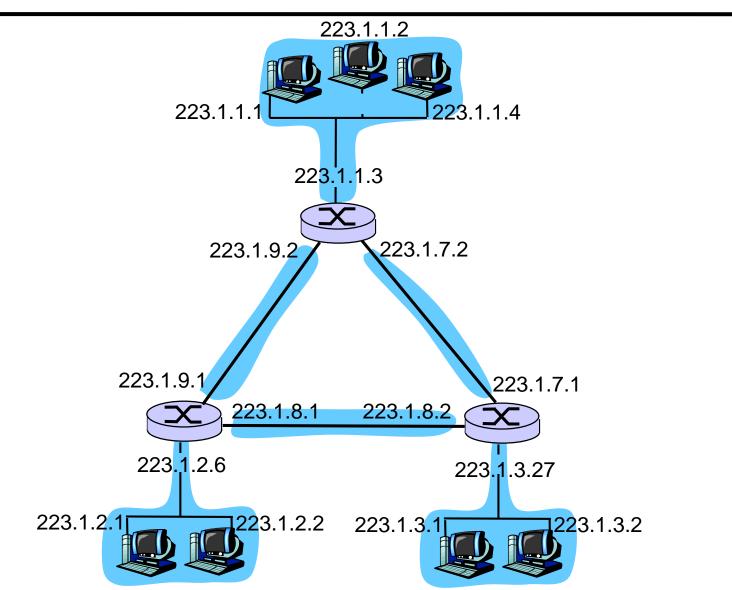

- ◆ IP address
 - » subnet part → high order bits
 - » host part → low order bits

223.1.3.0/24

- ◆ Subnet → set of interfaces
 - » with same subnet part of IP address
 - » can reach each other without router intervention

6 Subnets

IP Addressing - CIDR

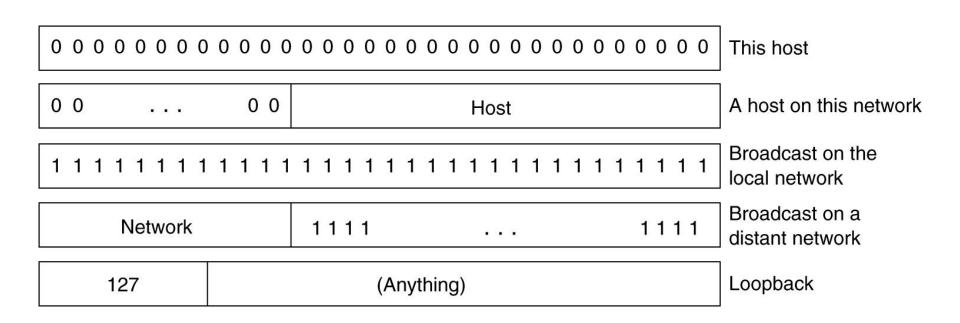

CIDR: Classless InterDomain Routing

- » subnet portion of address has arbitrary length
- » address format → a.b.c.d/x
 - where x is # bits in subnet portion of address

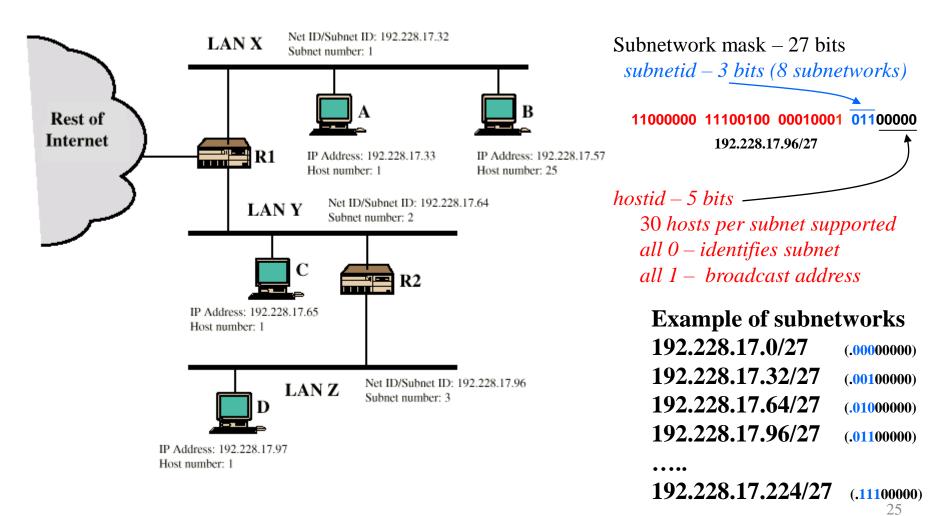

200.23.16.0/23

Special IP Addresses

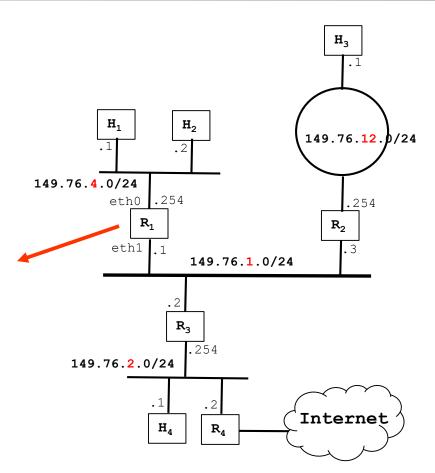

Forming Sub-Networks

Network 192.228.17.0/24 is divided in 8 subnetworks \rightarrow masks of 27 bits

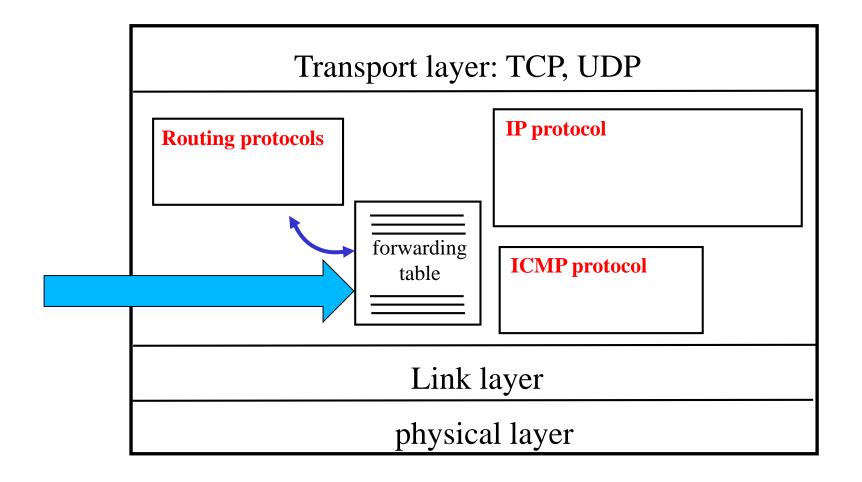

Forwarding Table at R1

Destination	Gateway	Interface
149.76.1.0/24	_	eth1
149.76.2.0/24	149.76.1.2	eth1
149.76.4.0/24	_	eth0
149.76.12.0/24	149.76.1.3	eth1
0/0	149.76.1.2	eth1

Forwarding Table at R1

• What is a loopback interface? What is its IP address?

IP Forwarding Function

• Forwarding table has entries in format

```
<networkAddress/mask, port>
```

- Forwarding function
 - » When a datagram arrives with destination address A, then
 - For each entry of the forwarding table

```
u val= A & mask* (e.g., mask=8, mask*=255.0.0.0)
u if (val == networkAddress & mask*)
```

- add corresponding output port to the set of candidate ports
- Select the port with the largest mask → most specific route
- » Example

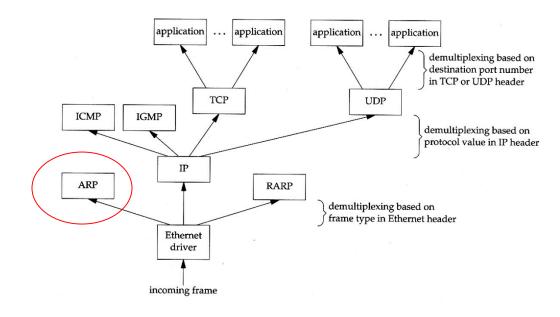

```
- frdTbl={<128.32.1.5/16,1>, <128.32.225.0/18,3>, <128.0.0.0/8,5>}
```

- Datagram with destination address A=128.32.195.1
- Set of candidate output ports \rightarrow {1,3,5}.
- Selected port→ 3 ← largest mask, 18 bits

Address Resolution Protocol

Demultiplexing

- Ethernet header (type)
 - » IP 0x0800
 - » ARP 0x0806
 - » RARP 0x8035
 - » IPX-0x8037
 - » IPv6 0x86DD
 - » MPLS 0x8847
- IP header (protocol)
 - » ICMP 1
 - » IGMP 2
 - » TCP 6
 - » UDP − 17
- TCP/UDP header (port)
 - \rightarrow FTP 21
 - » Telnet 23
 - » HTTP 80
 - » SMTP 25

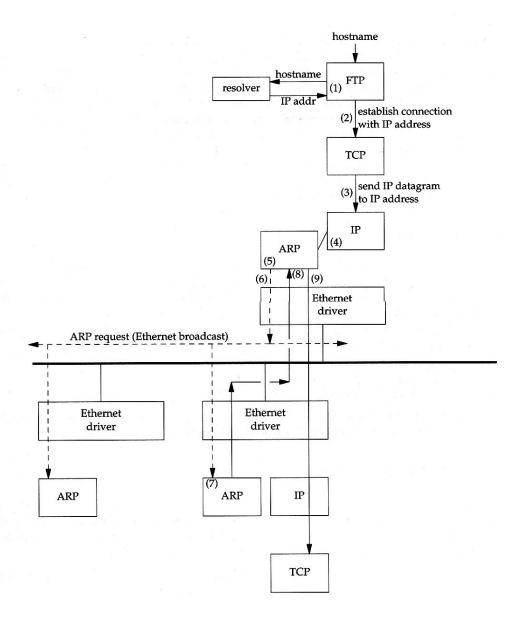

ARP – Address Resolution Protocol

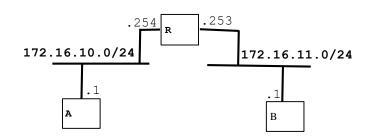

- A network interface has
 - » one MAC address
 - » one (or more) IP address(es)
- ARP: Address Resolution Protocol
 - Protocol used to
 obtain the MAC address
 associated to a given IP address
- RARP Reverse ARP
 - » Protocol used to
 - obtain the IP address
 - associated to a MAC address

ARP Example

_					
	frame hdr	ARP/RAR	ARP/RARP message		
0		15	15 16		
Hardware type:16		Protocol type:16			
	hlen:8	plen:8	ARP Operation:16		
Sender MAC addr (bytes 0-3)					
ser	nder MAC ad	dr (bytes 4-5)	sender IP addr (bytes 0-1)		
ser	nder IP addr	(bytes 2-3)	dest MAC addr (bytes 0-1)		
dest MAC addr (bytes 2-5)					
dest IP addr (bytes 0-3)					

- hardware type : Ethernet=1 ARCNET=7, localtalk=11
- protocol type : IP=0x800
- hlen: length of hardware address, Ethernet=6 bytes
- plen: length of protocol address, IP=4 bytes
- ARP operation : ARP request = 1, ARP reply = 2
 RARP request = 3, RARP reply = 4

◆ Assume host A sends an IP packet to host B and that this packet is forwarded by router R. What are the MAC and IP addresses (source and destination) observed?

• What roles does ARP play in this scenario?

Obtaining IP Addresses

How to Obtain IP Addresses

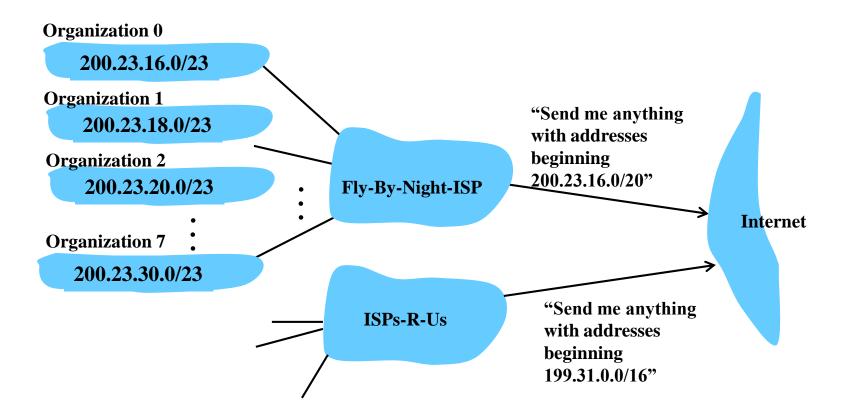

How does network get subnet part of IP addresss?

» Gets allocated portion of its provider ISP's address space

ISP's block	<u>11001000</u>	00010111	<u>0001</u> 0000	00000000	200.23.16.0/20
Organization 0	11001000	00010111	00010000	00000000	200.23.16.0/23
Organization 1	11001000				200.23.18.0/23
Organization 2					200.23.20.0/23
Organization 7	<u>11001000</u>	00010111	<u>0001111</u> 0	00000000	200.23.30.0/23

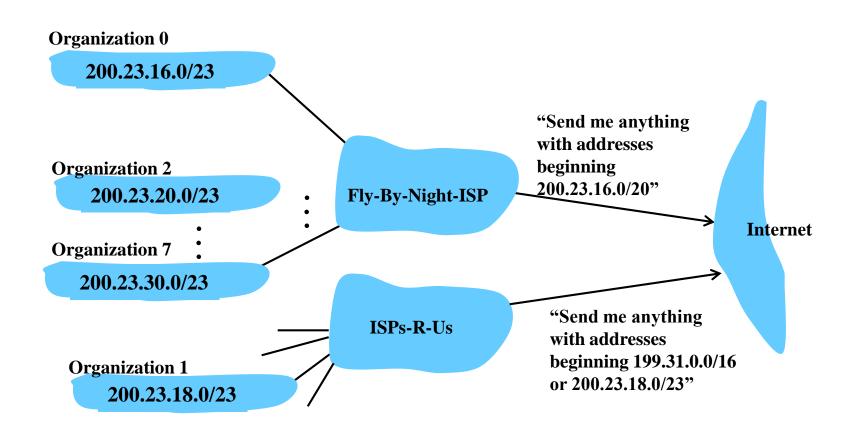

Hierarchical Addressing - Route Aggregation

 Hierarchical addressing allows efficient advertisement of routing information

Hierarchical Addressing - More Specific Routes

ISPs-R-Us has a more specific route to Organization 1

IP Addressing

How does an ISP get block of addresses?

- » From ICANN: Internet Corporation for Assigned Names and Numbers
- » ICANN
 - allocates addresses
 - manages Domain Name Service (DNS)
 - assigns domain names, resolves disputes

IP Addresses

How does a host obtain an IP address?

- » Hard-coded by system admin in a file
 - − Windows: control-panel \rightarrow network \rightarrow configuration \rightarrow tcp/ip \rightarrow properties
 - UNIX: /etc/rc.config, ifconfig
- » DHCP: Dynamic Host Configuration Protocol
 - dynamically get address from a server
 - "plug-and-play"

DHCP - Dynamic Host Configuration Protocol

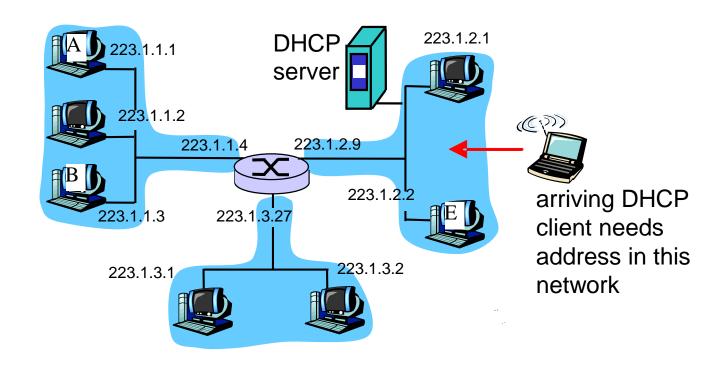

DHCP allows

- » host to dynamically obtain its IP address from network server when it joins network
- » reuse of addresses

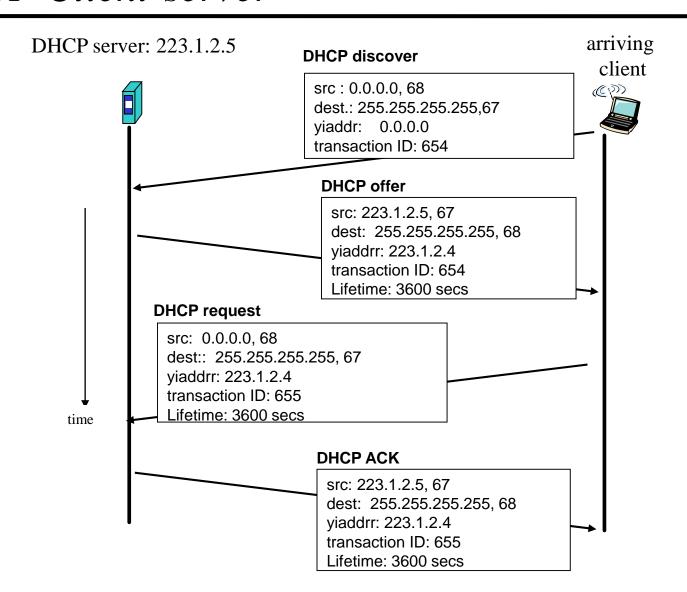

DHCP overview

- » host broadcasts "DHCP discover" msg
- » DHCP server responds with "**DHCP offer**" msg
- » host requests IP address "DHCP request" msg
- » DHCP server sends address "DHCP ack" msg

DHCP - Client-server Scenario

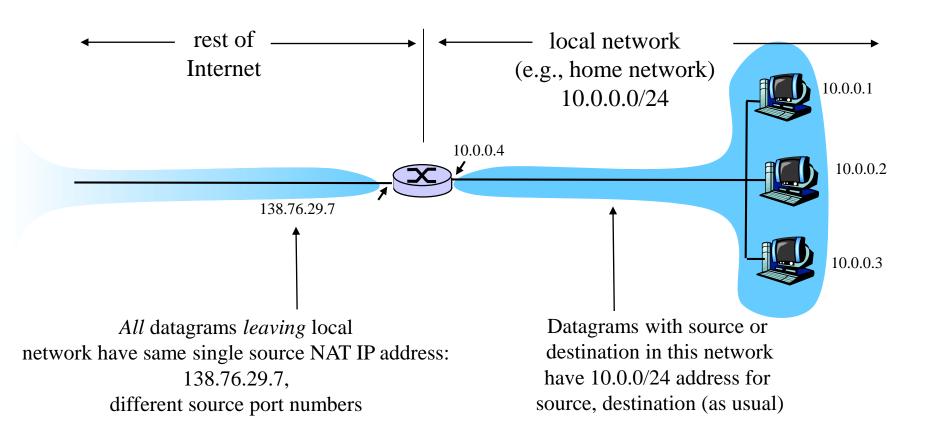

DHCP Client-server

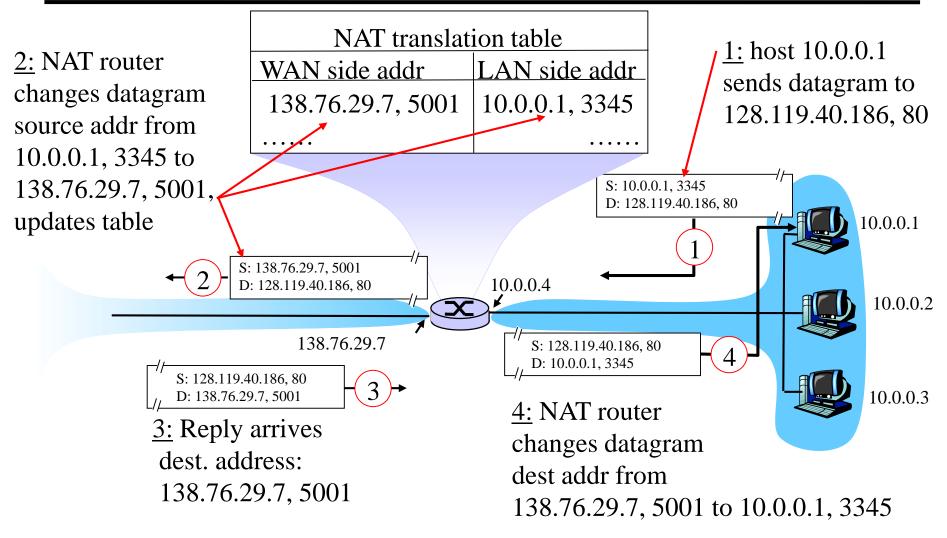

• Is it sufficient for an arriving client to acquire an IP address? What other relevant information shall this client obtain in order to start working with full functionality?

Network Address Translation

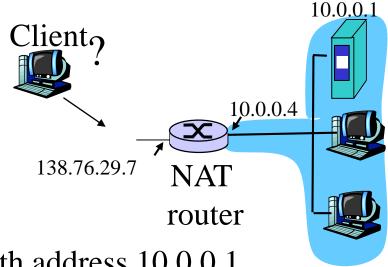

NAT - Network Address Translation

NAT - Network Address Translation

NAT Traversal

- Client wants to connect to server with address 10.0.0.1
 - » but server address 10.0.0.1 is private
 - » only one externally visible NATed address: 138.76.29.7
- ◆ Possible solution Port forwarding
 - » statically configure NAT
 to forward incoming connection requests at given port to server
 - » e.g., (138.76.29.7, port 2500) always forwarded to 10.0.0.1 port 25000

• How to enable two hosts behind NAT boxes to communicate? How does Skype enable voice calls between these two clients?

Internet Message Control Protocol

ICMP - Internet Control Message Protocol

- Used by router or host
 - » to send layer 3 error or control messages
 - » to other hosts or routers
- Carried in IP datagrams

0	8	16		
Type	Code	Code Checksum		
Unused				
IP Header + 64 bits of original datagram				

(a) Destination Unreachable; Time Exceeded; Source Quench

0	8	16	31	
Type	Code Checksum			
Pointer	Unused			
IP Header + 64 bits of original datagram				

(b) Parameter Problem

0	8	16	31	
Type	Type Code Checksum			
Gateway Internet Address				
IP Header + 64 bits of original datagram				

(c) Redirect

0	8	16	31	
Type	Code	Checksum		
Identifier Sequence Number				
Optional data				

(d) Echo, Echo Reply

0	8	16	31	
Type	Code	Checksum		
Identifier		Sequence Number		
Originate Timestamp				

(e) Timestamp

0	8	16	31		
Type	Code	Checksum			
Ider	Identifier Sequence Number				
	Originate Timestamp				
	Receive Timestamp				
Transmit Timestamp					

(f) Timestamp Reply

0	8	16	31
Type	Code	Checksum	
Identifier		Sequence Number	

(g) Address Mask Request

0	8	16	31		
Type	Code	Checksum			
Iden	tifier	Sequence Number			
Address Mask					

(h) Address Mask Reply

Type C	ode	Description
0 ()	echo reply (ping)
3 ()	dest. network unreachable
3 1	1	dest host unreachable
3 2	2	dest protocol unreachable
3 3	3	dest port unreachable
3 6	5	dest network unknown
3	7	dest host unknown
4 ()	source quench (congestion
		control - not used)
5		Redirect
8 ()	echo request (ping)
9 ()	route advertisement
10 ()	router discovery
11 ()	TTL expired
12 ()	bad IP header

Ping – Echo Request, Echo Reply

```
sun% ping gemini
PING gemini: 56 data bytes
64 bytes from gemini (140.252.1.11): icmp seq=0. time=373. ms
64 bytes from gemini (140.252.1.11): icmp seq=1. time=360. ms
64 bytes from gemini (140.252.1.11): icmp seg=2. time=340. ms
64 bytes from gemini (140.252.1.11): icmp seq=3. time-320. ms
64 bytes from gemini (140.252.1.11): icmp seq=4. time=330. ms
64 bytes from gemini (140.252.1.11): icmp seg=5. time=310. ms
64 bytes from gemini (140.252.1.11): icmp seg=6. time==290. ms
64 bytes from gemini (140.252.1.11): icmp seq-7. time=300. ms
64 bytes from gemini (140.252.1.11): icmp seq=8. time=280. ms
64 bytes from gemini (140.252.1.11): icmp seq=9. time=290. ms
64 bytes from gemini (140.252.1.11): icmp seg=10. time=300. ms
64 bytes from gemini (140.252.1.11): icmp seq=ll. time=280. ms
--gemini PING Statistics--
12 packets transmitted, 12 packets received, 0% packet loss
round-trip (ms) min/avg/max = 280/314/373
```

Traceroute and ICMP

- Source sends series of UDP segments to destination
 - » first segment has TTL =1
 - » second segment has TTL=2, ...
 - » unlikely port number
- When nth datagram arrives

to nth router

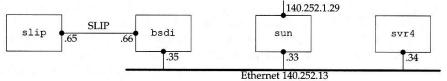

- » router discards datagram
- » sends to source:
 ICMP TTL expired
- » message includes router name & IP address

svr4% traceroute slip

traceroute to slip (140.252.13.65), 30 hops max. 40 byte packets 1 bsdi (140.252.13.35) 20 ms 10 ms 10 ms 2 slip (140.252.13.65) 120 ms 120 ms 120 ms

slip% traceroute svr4

traceroute to svr4 (140.252.13.34), 30 hops max, 40 byte packets 1 bsdi (140.252.13.66) 110 ms 110 ms 110 ms 2 svr4 (140.252.13.34) 110 ms 120 ms 110 ms

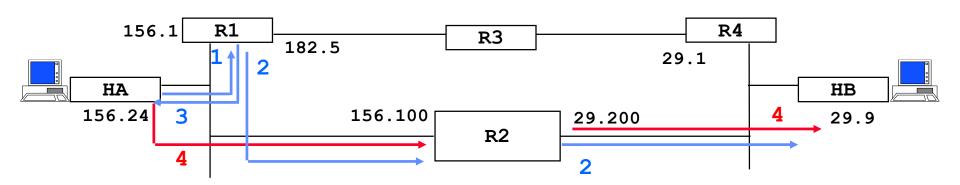

- When ICMP message arrives, source calculates RTT
- Traceroute does this 3 times for each TTL
- Stop criterion
 - » UDP segment eventually arrives at destination host
 - » Destination returns ICMP "dest port unreachable" packet
 - » source stops

ICMP Redirect

- General routing principle of the TCP/IP architecture
 - » routers have extensive knowledge of routes
 - » hosts have minimal routing information → learn routes also from ICMP redirects
- ICMP redirect message
 - » Sent by router R1 to source host A
 - when R1 receives a packet from A with destination = B, and R1
 - ☐ finds that the next hop is R2 and
 - □ A is on-link with R2
 - » R1 sends ICMP redirect to A saying next hop for destination B is R2
 - » A updates its forwarding table with a host route

ICMP Redirect Format

ICMP Redirect Example

	dest IP addr	srce IP addr	prot	data part
1:	193.154.29.9	193.154.156.24	udp	xxxxxxx
2:	193.154.29.9	193.154.156.24	udp	xxxxxx
3:	193.154.156.24	193.154.156.1	icmp	type=redir code=host cksum
				193.154.156.100
				xxxxxxx (28 bytes of 1)
4:	193.154.29.9	193.154.156.24	udp	

ICMP Redirect Example

After 4

HA \$ netstat -nr Routing Table:			
Destination	Gateway	Flags	Interface
 127.0.0.1	127.0.0.1	UH	100
193.154.29.9	193.154.156.100	UGH	eth0
193.154.156.0	193.154.156.24	U	eth0
224.0.0.0	193.154.156.24	U	eth0
default	193.154.156.1	UG	eth0

Flags:

U - route Up

G - route to a Gateway (next hop router)

H - route to a Host

IPv6

The Need of a New IP

- ◆ IPv4
 - Small addressing space (32 bits)
 - Non-continuous usage
 - Some solutions used to overcome these problems
 private networks (NAT), classless networks (CDIR)
- IETF developed new IP version: **IPv6**
 - Same principles of IPv4
 - Many improvements
 - Header re-defined

IPv6 – *Improvements*

- » 128 bit addresses (16 octets, 8 shorts). No classes
- » Better QoS support (native flow label)
- » Native security functions (peer authentication, data encryption)
- » Autoconfiguration (Plug-n-play)
- » Routing
- » Multicast

Address Representation

• 8 x 16 bit, hexadecimal. Separated by :

47CD: 1234: 3200: 0000: 0000: 4325: B792: 0428

- ♦ Compressed format: FF01:0:0:0:0:0:0:0:43 → FF01::43
- ♦ Compatibility with IPv4: 0:0:0:0:0:0:13.1.68.3 or ::13.1.68.3
- ♦ Loopback address: ::1
- Network prefix described by / , same as IPv4
 - » FEDC:BA98:7600::/40 \rightarrow network prefix = 40 bits

Reserved Addresses

Allocation	Prefix (binary)	Fraction of Address Space
Unassigned	0000 0000	1/256
Unassigned	0000 0001	1/256
Reserved for NSAP Allocation	0000 001	1/128
Unassigned	0000 01	1/64
Unassigned	0000 1	1/32
Unassigned	0001	1/16
Global Unicast	001	1/8
Unassigned	010	1/8
Unassigned	011	1/8
Unassigned	100	1/8
Unassigned	101	1/8
Unassigned	110	1/8
Unassigned	1110	1/16
Unassigned	1111 0	1/32
Unassigned	1111 10	1/64
Unassigned	1111 110	1/128
Unassigned	1111 1110 0	1/512
Link-Local Unicast Addresses	1111 1110 10	1/1024
Site-Local Unicast Addresses	1111 1110 11	1/1024
Multicast Addresses	1111 1111	1/256

Adresses – Link-Local, Global Unicast, Anycast, Multicast

» Link-Local

- Used for communication between hosts in the same LAN/link
- Address built from MAC address
- Routers do not foward packets having Link-Local destination addresses

» Global Unicast

- Global addresses
- Address: network prefix + computer identifier
- Structured prefixes

Network aggregation; less entries in the router forwarding tables

» Anycast

- Group address; packet is received by any (only one) member of the group

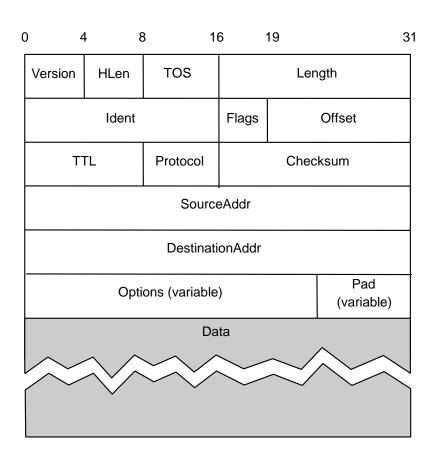

» Multicast

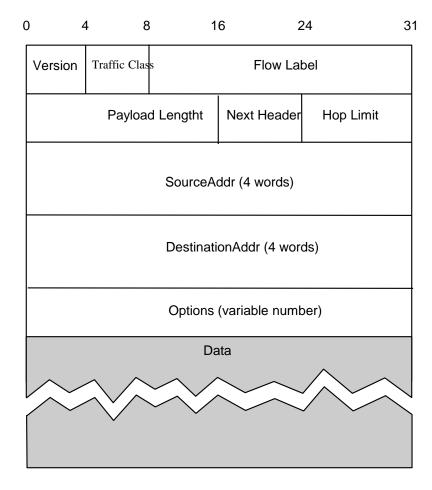

Group address; packet received by all the members of the group

Address Formats

```
n bits | m bits | 128-n-m bits
                                          □ Global Unicast Address
                                                  (2000::/3)
|001 global rout prefix | subnet ID | interface ID
   10 I
                                                  Link-Local Unicast address
| bits
              54 bits
                                 64 bits
                                                  (fe80::/10)
|11111111010| 0
                                interface ID
   10 I
          54 bits | 64 bits
                                                   Site-Local Unicast address
                                                    (fec0::/10) (not used)
              subnet ID
                                interface ID
                  n bits
                                                    Anycast address
                                   | 128-n bits
              subnet prefix
                                  I 00000000000000 I
                                                   Multicast address
|11111111|flgs|scop|
                          group ID
                                                   Scope - link, site, global, ...
+-----
                                                           (ff::/8)
```

Headers IPv4 and IPv6

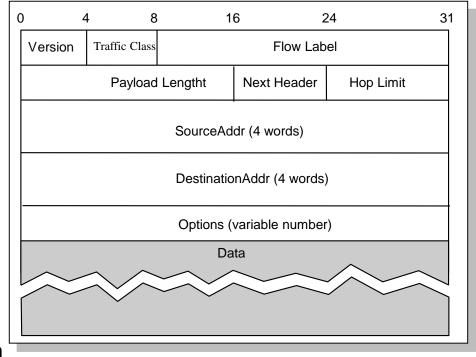

IPV4

IPv6

64

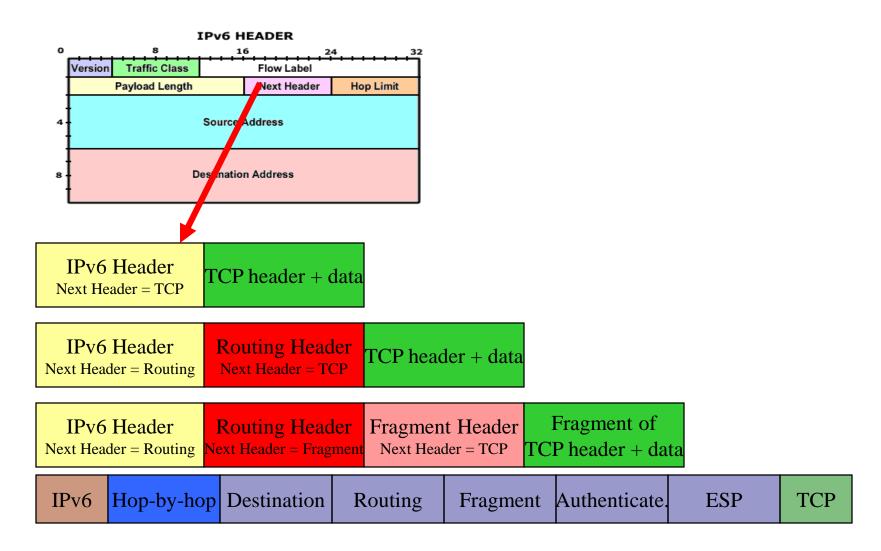

IPv6 Header

- Flow label → identifies packet flow
 - » QoS, resource reservation
 - » Packets receive same service
- Payload length
 - » Header not included
- Hop limit = TTL(v4)
- Next header
 - » Identifies next header/extension

◆ Options → included as extension headers

Extension Headers

Extension Headers

» Hop-by-hop

additional information, inspected by every node traversed by the packet Other headers are inspected only at the destination or at pre-defined nodes

» Destination: Information for the destination node

» Routing: List of nodes to be visited by the packet

» Fragmentation: Made by the source; it shall find MPU

» Authentication: Authentication (signature) of packet header

» ESP: Data encryption

Example of Lab Network

Identifier IEEE EUI-64

Method to create a IEEE EUI-64 identifier from an IEEE 48bit MAC identifier. This is to insert two octets, with hexadecimal values of 0xFF and 0xFE, in the middle of the 48 bit MAC (between the company_id and vendor supplied id). For example, the 48 bit IEEE MAC with global scope:

where "c" are the bits of the assigned company_id, "0" is the value of the universal/local bit to indicate global scope, "g" is individual/group bit, and "m" are the bits of the manufacturer-selected extension identifier. The interface identifier would be of the form:

10	1 1	3 3	4 4	6
10	5 6	1 2	7 8	3

Protocol Neighbor Discovery (ND)

- IPv6 node uses ND for
 - » Find other nodes in the same link /LAN
 - » Find a node MAC address
 ND substitutes ARP
 - » Find router(s) in its network
 - » Mantaining information about neighbour nodes
- ND similar to the IPv4 functions
 - » ARP IPv4
 - » ICMP Router Discovery
 - » ICMP Redirect

ND Messages

- » ICMP messages (over IP); using *Link Local* addresses
- » Neighbor Solicitation

Sent by a host to obtain MAC address of a neighbour / to verify its presence

- » **Neighbor Advertisement**: Answer to the request
- » Router Advertisement

Information about the network prefix; periodic or under request Sent by router to IP address *Link Local multicast*

- » Router Solicitation: host solicits from router a Router Advertisment message
- » **Redirect**: Used by a router to inform a host about the best route to a destination

Homework

- 1. Review slides
- 2. Read from Kurose&Ross
 - Chapter 4 The Network Layer
 (this set of slides follows mainly Kurose&Ross)
- 3. Or, from Tanenbaum,
 - » Chapter 5 The Network Layer
- 4. Answer questions at moodle
